## Housing

Fire belly newts need a terrarium that is at least 10 gallons in size. The terrarium should have a secure lid to prevent the newts from escaping, and it should be equipped with a filter and a heater to keep the water clean and at the correct temperature.

The substrate for the terrarium should be a mix of sand and gravel. The sand will help to keep the water clean, and the gravel will provide the newts

with a place to hide. You can also add some live plants to the terrarium, which will help to provide the newts with oxygen and hiding places.

## **Feeding**

Fire belly newts are carnivores, and they eat a variety of live food, such as crickets, mealworms, and bloodworms. You can also feed your newts frozen food, such as brine shrimp and mysis shrimp.

It is important to vary your newt's diet to ensure that they are getting all the nutrients they need. You should feed your newts 2-3 times per week.

## **Health**

Fire belly newts are relatively healthy animals, but they can be susceptible to a variety of health problems, such as skin infections, respiratory infections, and digestive problems.

It is important to take your newt to the vet for regular checkups to ensure that they are healthy. You should also watch for any signs of illness, such as lethargy, loss of appetite, or changes in skin color.

## **Breeding**

Fire belly newts can be bred in captivity. However, it is important to note that breeding newts can be challenging, and it is not recommended for beginners.

If you are interested in breeding fire belly newts, you will need to set up a separate breeding tank. The breeding tank should be at least 20 gallons in size, and it should have a secure lid to prevent the newts from escaping.

You will also need to provide the newts with a place to lay their eggs. You can do this by adding some live plants to the tank, or by providing the newts with a piece of cork bark.

Once the newts have laid their eggs, you will need to remove them from the tank and place them in a separate container. The eggs will hatch in about 2-3 weeks.

Fire belly newts are beautiful and fascinating creatures that can make great pets. However, they do require specific care in order to thrive. This comprehensive guide has provided you with all the information you need to know about fire belly newt care, from housing and feeding to health and breeding. With proper care, your fire belly newt can live a long and healthy life.
